

Step 1

My main motivation for working on the project is to create something useful and improve my skills as a software developer. I want to learn from the challenges I encounter instead of giving up when things become difficult. My goals are to complete the project successfully, develop better problem-solving skills, improve my ability to work under pressure, and gain more experience in software development. I also want to become more confident in handling complex tasks and making good decisions. What drives me to succeed is the feeling of improvement and accomplishment when I finish something that was difficult at first. I am motivated by the opportunity to learn new things, solve problems, and create software that can help people. Remembering these reasons can help me stay focused when the project becomes stressful.

Step 2

1. **Tight deadlines**, because, there may not be enough time to complete every part of the feature.
2. **Limited resources**. There may be limited tools, people, equipment, or information available.
3. **Conflicting priorities**, because, other tasks may need attention while I am working on the new feature.
4. **Stress and loss of motivation**. Continuous problems and pressure may make it difficult to stay focused.

Step 3

- **Tight Deadlines** – I'll break the feature into smaller tasks and prioritize the most important ones. Then, I'll discuss the deadline with the manager or team if the required work cannot realistically be completed on time.
- **Limited Resources** – I will use the available documentation, tools, and reliable learning resources to find solutions. I will also ask teammates or other experienced people for advice when I encounter a problem that I cannot solve alone.
- **Conflicting Priorities** – I'll create a task list and identify which tasks are most important and urgent. Then, I will communicate with the team or manager to clarify priorities and avoid spending too much time on less important tasks.
- **Stress and Loss of Motivation** – I will take short breaks when necessary to avoid burnout and maintain concentration. I will also remind myself of the purpose of the project and the skills I can gain from completing it.

Step 4

My plan is to stay organized, focus on one important task at a time, and regularly check my progress. At the beginning of the project, I will divide the feature into smaller tasks and identify which ones should be completed first. I will set realistic daily goals and track the tasks that I finish. When I encounter a problem, I will first try to understand the cause and look for possible solutions. If I cannot solve the problem within a reasonable amount of time, I will ask for help instead of allowing one problem to stop the entire project. I will also manage my time by taking short breaks and avoiding unnecessary distractions. If deadlines or priorities become unrealistic, I will communicate with my team or manager so that we can decide which tasks should receive more attention. To maintain my motivation, I will regularly remind myself of my goals and recognize the progress I have already made. At the end of each week, I will review what I accomplished, identify what needs improvement, and adjust my plan when necessary.

Step 5

[CODE]

```
import datetime
```

```
today = datetime.date.today()
```

```
# Schedule self-reflection time
```

```
self_reflection_time = today + datetime.timedelta(days=7)
```

```
print(self_reflection_time)
```

[TERMINAL]

```
sandbox@userpriv-imac ~ % python3 << 'EOF'
```

```
import datetime
```

```
today = datetime.date.today()
```

```
# Schedule self-reflection time
```

```
self_reflection_time = today + datetime.timedelta(days=7)
```

```
print(self_reflection_time)
```

```
EOF
```

```
2026-09-26
```

```
sandbox@userpriv-imac ~ %
```
